Serial KeyQ: ASP.NET MVC Entity

Framework, updating and deleting Hello I have

question I want to store details like Name, contact number, address etc. in database. I am using ASP.NET MVC Entity Framework. My question is, when I created an object of a class should I edit and update the details there after which I don't know if there is any control mechanism by which I can save that object in database or not. Can you suggest me anything if you have knowledge about this problem. A: Your object has properties that map to the database columns, so the data you enter into your view belongs to that object and these properties. When you click a button to save the object, you call the object's 'Save' method. There are a number of different ways this can be done, but the idea is the same: create a new instance of your object with the appropriate

data, and call the 'Save' method. The only thing to keep in mind is whether all of your objects needs to save when you save the domain or if you have a 'dirty' property that will tell the object if it is ready to be saved (something you set when you load the object from the database, etc). In all of these cases, the 'Save' method should look like this:

```
public static void
Save(MyObject myObject) { if
(myObject.IsDirty) { //Update values from the
domain to database
DataObject.Save(myObject); myObject.IsDirty
= false; } //Save all other data, etc. You can
write your code as one big block but I //prefer to
keep the logic separate for clarity. } I love
making things and trying to figure them out.
Sometimes it works. Sometimes it doesn't.
Sometimes I'm one of those that enjoys learning
things so f678ea9f9e
```
